

Project Proposal Title

JAKUB BŁASZCZYK, University of Aveiro, Portugal

CAROLINA REIS, University of Aveiro, Portugal

Write 4–6 sentences summarizing the problem, the dataset, the proposed method, and the evaluation plan after the rest of the proposal is finished.

Additional Key Words and Phrases: project proposal, placeholder draft

1 Problem Statement

1.1 Background and Motivation

[Jakub] *Explain the application domain and why this problem matters. Keep it concrete: what is the real task, who benefits from solving it, and why it is interesting enough for a final project.*

1.2 Project Goal and Scope

[Carolina] *State clearly what the model will do. Define the input, the output, and the scope. Also mention what is intentionally out of scope so the proposal stays realistic.*

1.3 Expected Contribution

[Jakub/Carolina] *Write 1 short paragraph on what this project is expected to contribute. Example angles: a lightweight baseline, a comparison of small models, an explainability analysis, or an efficiency vs performance study.*

2 Dataset

2.1 Source and Access

[Jakub] *Name the dataset, where it comes from, and how we can access it. Include the official link and mention whether the data is public, restricted, or requires preprocessing before use.*

2.2 Size and Label Structure

[Carolina] *Describe the dataset size, the number of classes or outputs, and any class imbalance issues. If relevant, mention image resolution, modalities, or train/validation/test splits.*

2.3 Preprocessing

[Jakub] *Describe the preprocessing pipeline. Example points: resizing, normalization, augmentation, train/validation split, handling missing labels, filtering noisy samples, or converting grayscale to RGB.*

2.4 Sample Data

[Carolina] *Add a short paragraph describing what a typical sample looks like. Later, include one small figure or table with example samples if useful.*

3 Methodology

3.1 Baseline Approach

[Jakub] *Describe the simplest reasonable baseline. This can be a small CNN, logistic regression on extracted features, or another lightweight benchmark that gives us something to compare against.*

Authors' Contact Information: Jakub Błaszczuk, ?@ua.pt, University of Aveiro, Aveiro, Portugal; Carolina Reis, luanacarolina@ua.pt, University of Aveiro, Aveiro, Portugal.

3.2 Proposed Model

[Carolina] *Describe the main architecture we plan to use. Explain why it fits the problem and why it is realistic given our time and compute constraints.*

3.3 Training Setup

[Jakub] *Mention optimizer, learning rate strategy, loss function, batch size, number of epochs, hardware assumptions, and any transfer learning choices. Keep this lightweight and realistic.*

3.4 Architecture Diagram

[Carolina] *Replace the placeholder figure below with a simple pipeline or architecture diagram once the topic is fixed.*

Fig. 1. Placeholder architecture or pipeline diagram.

4 Evaluation Plan

4.1 Metrics

[Jakub] *List the main evaluation metrics. Choose metrics that match the task, such as accuracy, macro-F1, AUROC, IoU, Dice, precision, recall, or inference time.*

4.2 Baselines and Comparisons

[Carolina] *Explain what we will compare against. This can include the baseline model, a pretrained lightweight model, or an ablation such as with and without augmentation or explainability.*

4.3 Experimental Protocol

[Jakub] *Describe how the experiments will be run fairly. Mention train/validation/test split, cross-validation if needed, repeated runs if relevant, and how hyperparameter choices will be kept reasonable.*

4.4 Success Criteria

[Carolina] *Define what would count as a successful outcome. Example: achieving a target macro-F1, outperforming the baseline by a clear margin, or reaching a good trade-off between performance and efficiency.*

5 Ethics and Limitations

5.1 Potential Biases

[Jakub] *Discuss dataset bias, class imbalance, domain shift, demographic bias, labeling noise, or any other source of unfairness or over-optimistic evaluation.*

5.2 Limitations of the Approach

[Carolina] *State the main technical limitations honestly. Example points: small dataset, limited compute, weak real-world generalization, simplified problem setup, or restricted evaluation conditions.*

5.3 Responsible Use

[Jakub/Carolina] *Add a short paragraph explaining how the model should and should not be used. This is especially important for medical, safety-critical, or decision-support tasks.*

References

Add the main references after the topic is chosen. A good starting set is: 1 dataset/source paper, 1 baseline paper, 1 main model paper, and 1 or 2 related-work papers.
